Heading 4

	SELECT Id, ActivityDate, Subject FROM Task WHERE ActivityDate > NEXT_N_DAYS:365

Mass deleting future tasks greater than one year from now

```
public class DeleteYearOldTask implements Database.Batchable<SObject> {

    public Database.QueryLocator start(Database.BatchableContext BC){
        return Database.QueryLocator([
            SELECT Id FROM Task WHERE activitydate!=null and ActivityDate >
NEXT_N_DAYS:365
        ]);
    }

    public void execute(Database.BatchableContext BC, List<SObject> scope){
        List<Task> toDelete= (List<Task>) scope;
        Database.DeleteResult[] results= Database.delete(toDelete, false);

        for(Integer i=0; i<results.size();i++){
            if(!results.isSuccess()){
                for(Database.Error err: results[i].getErrors()){
                    System.debug(
                        'Delete failed for Id=' + toDelete[i].Id
                        + ': ' + err.getStatusCode() + ' - ' + err.getMessage()
                    );
                }
            }
        }
    }

    public void finish(Database.BatchableContext BC){
        System.debug('DeleteYearOldTasksBatch finished. Job Id: ' +
BC.getJobId());
    }
}
```

```
// Instantiate the batch class
DeleteYearOldTask deleteBatch = new DeleteYearOldTask();

// Execute the batch job
// The second parameter (scope size) is set to 200, which is the maximum allowed.
// Smaller sizes may be needed if the delete triggers complex automation.
Database.executeBatch(deleteBatch, 200);

System.debug('Batch job submitted to delete all AcquiredAccount__c records.');
```

Apex Jobs

Monitor the status of all Apex jobs, and optionally, abort jobs that are in progress.

Percent of Asynchronous Apex Used: 0%

You have currently used 1 asynchronous Apex operations out of an allowed 24-hour organization limit of 250,000. To learn about how this limit is calculated and what contribute [Apex Limits](#) topic.

View: All [Create New View](#)

Mass deleting Acquired Account records

```
public class DeleteAcquiredAccountsBatch implements Database.Batchable<SObject> {

    public Database.QueryLocator start(Database.BatchableContext bc) {
        // Query all records of the custom object
        return Database.getQueryLocator([
            SELECT Id
            FROM AcquiredAccount__c
        ]);
    }

    public void execute(Database.BatchableContext bc, List<SObject> scope) {
        // Cast to concrete type for clearer debugging/logging if desired
        List<AcquiredAccount__c> toDelete = (List<AcquiredAccount__c>) scope;

        // Use Database.delete with allOrNone = false to allow partial success
        Database.DeleteResult[] results = Database.delete(toDelete, false);

        // Optional: log failures to the debug log
        for (Integer i = 0; i < results.size(); i++) {
            if (!results[i].isSuccess()) {
                for (Database.Error err : results[i].getErrors()) {
                    System.debug(
                        'Delete failed for Id=' + toDelete[i].Id
                        + ' : ' + err.getStatusCode() + ' - ' + err.getMessage()
                    );
                }
            }
        }
    }

    public void finish(Database.BatchableContext BC) {
        System.debug('DeleteAcquiredAccountsBatch finished. Batch Id: ' + BC.getJobId());
        // Optional: Send an email notification to the administrator upon completion.
        AsyncApexJob job = [SELECT Id, Status, NumberOfErrors, JobItemsProcessed, TotalJobItems
            FROM AsyncApexJob
            WHERE Id = :BC.getJobId()];

        System.debug('Batch Job finished. Status: ' + job.Status +
            ', Total Records: ' + job.TotalJobItems +
            ', Errors: ' + job.NumberOfErrors);

        // Example Email Notification:

        Messaging.SingleEmailMessage mail = new Messaging.SingleEmailMessage();
        String[] toAddresses = new String[] { 'kazimsyed9911@gmail.com' }; // <-- CHANGE THIS EMAIL
        mail.setToAddresses(toAddresses);
        mail.setSubject('Batch Delete Job Complete: AcquiredAccount__c');
        mail.setPlainTextBody('The mass deletion of AcquiredAccount__c records has finished. Status: ' + job.Status);
        Messaging.sendEmail(new Messaging.SingleEmailMessage[] { mail });
    }
}
```

Restoring Records from the recycle bin

Setup > Recycle bin	
	You have records deleted by you in my recycle bin and records deleted by others in Org Recycle bin.
	So it doesn't delete, it just flag the isDelete field to be true. The way to hard-delete is using data-loader. You can also sort by deletedate.
The way mike did it.	<pre>Date x=Date.today.addyears(1) select id from task where activitydate > x;</pre>

FAQ

does scope(0) means the the first chunk or is it the first record of the chunk.
First record of the chunk. Its a one dimensional array that gets converted into subarray that is chunks. Chunk 1 would from i=0-200 scope(i) chunk 2 would from i=201-400 scope(i)

```
public void execute(Database.BatchableContext bc, List<SObject> scope) { // Cast
to concrete type for clearer debugging/logging if desired
List<AcquiredAccount__c> toDelete = (List<AcquiredAccount__c>) scope; // Use
Database.delete with allOrNone = false to allow partial success
Database.DeleteResult[] results = Database.delete(toDelete, false); is their a need
to cast it. or can we do? Database.DeleteResult[] results = Database.delete(scope,
false);
```

No, its not necessary.

1. clarity

Casting tells you what object type you EXPECT.

2. Strong typing

Code completion in VS Code

- Compile-time validation
- Access to child fields during debugging before DML

Simple dml stmt	Insert contactstoinsert update accounts delete tasks
Partial dml stmt	Database.insert(records, false) Database.update(records, false) Database.delete(records, false)
Error handling	Result.getId() Result.isSuccess() Result.getErrors()

Estimating Your Organization Code Coverage

Setup → Apex classes	Percent of Apex Used: 1.59% You are currently using 95,320 characters of Apex Code (excluding comments and @isTest annotated classes) in your organization, out of an allowed limit of 6,000,000 characters. Use includes both Apex Classes and Triggers defined in your organization. Code Coverage: 18% Your overall code coverage is currently 18%. To deploy code to production, you must have at least 75%. Compilation Complete Compilation Successful

Creating a validation rule to enforce Positive numeric values

	You create validation rules at the object level.
	No of employees could be negative without validation rules.
Object manager → lead → validation rule	Error Condition Formula Example: Discount_Percent_c>0.30 More Examples... Display an error if Discount is more than 30% If this formula expression is true, display the text defined in the Error Message area Insert Field Insert Operator ▾ NumberOfEmployees < 0 Check Syntax Error Message Example: Discount percent cannot exceed 30% This message will appear when Error Condition formula is true Error Message No of employees can't be negative This error message can either appear at the top of the page or below a specific field on the page Error Location ☐ Top of Page ☒ Field No. of Employees ▾ i

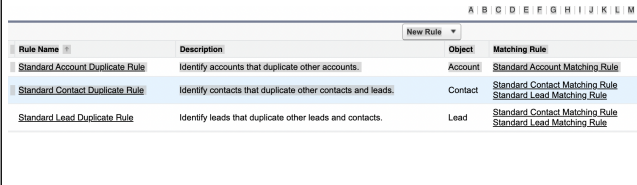

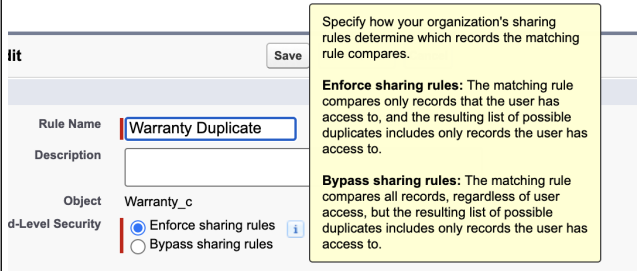

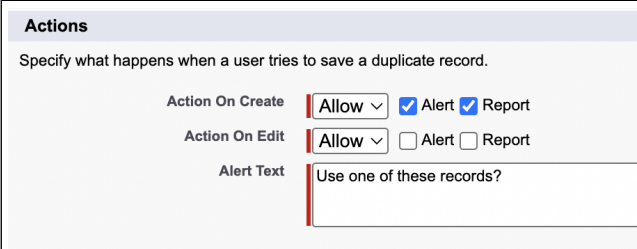

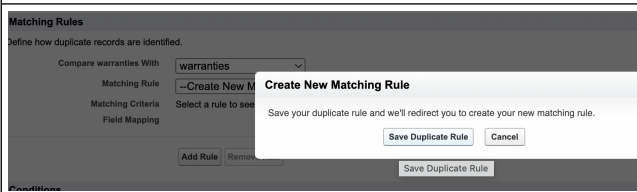

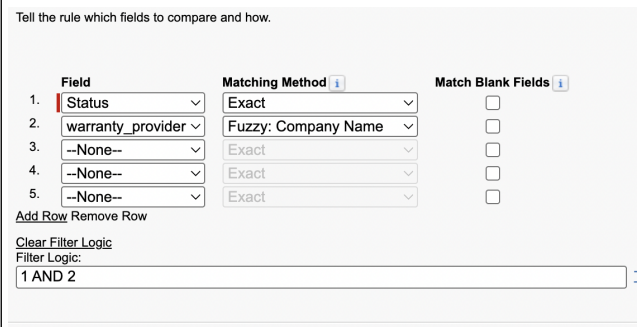

Make a field Required via a Validation rule

Task	How to make a field required?
We can't uncheck it to make not required.	
* Name Salutation --None-- ▼ First Name First Name * Last Name ⊘ Last Name Complete this field.	Name and lname is required.
The way we do it. Note: it doesn't retroactively fix the issue of legacy records. It will block any future updates on this record. Note: you can combine validation rule. But then u are occupied with a vague error message that states that either the field is empty or #ofemployees is less than zero.	Insert Field Insert Operator ▼ ISBLANK (FirstName) Check Syntax Error Message Example: Discount percent cannot exceed 30% This message will appear when Error Condition formula is true Error Message Field is Required This error message can either appear at the top of the page or below a sp Error Location ○ Top of Page ● Field First Name

Use chatgpt to generate validation rules

refer to prompt library

Duplicate Management and Duplicate rules

	You will find duplicate rules for account, contact, lead.
	
	Only compares record which user has. OR Even compare that.
	You can allow to create a duplicat record and inform the user. In case of insert from dataloader, it will trigger an error and those records will not be inserted.
	
	Then click the activate button. We can also set the criteria to when to run the rule.

Potential Duplicates Lightning component

	It only exists for std objects like account, contact and lead. Even if u open the lightning app builder, u wont see it as a components in the detail section.
--	---

Merging duplicates

	View Duplicates To merge duplicates, choose up to 3 contacts. Then click Next and choose the fields to keep. ▼ Contacts (2) <table> <tr> <th>Name</th><th>Account Name</th><th>Account Site</th><th>Phone</th><th>Email</th><th>Contact Owner Alias</th></tr> <tr> <td>✓ Nadie Person</td><td>nadp</td><td></td><td>444-654-2399</td><td>nadp@stores.com</td><td>MWhee</td></tr> <tr> <td>✓ Nadie Person</td><td>nadp</td><td></td><td>444-654-2399</td><td>nadp@stores.com</td><td>autoproc</td></tr> </table>	Name	Account Name	Account Site	Phone	Email	Contact Owner Alias	✓ Nadie Person	nadp		444-654-2399	nadp@stores.com	MWhee	✓ Nadie Person	nadp		444-654-2399	nadp@stores.com	autoproc

Created a joined report

	Is a type of reports that combines data from multiple report types to give u a comprehensive view of ur data.
	A joined report is a type of report in Salesforce that allows you to combine data from multiple report types, giving you a more comprehensive view of your data. Here are several scenarios where a joined report would be useful: 1. When you need to combine data from different objects: Let's say you want to analyze your sales data by region and by product. You have a report for your sales by region and another report for your sales by product, but you need to see the data together to get a complete picture. By creating a joined report, you can combine the data from both reports to see the sales by region and by product in one place. 2. When you need to compare data across different time periods: If you want to see how your sales have changed over time, you might create two reports: one for this year's sales and one for last year's sales. With a joined report, you can easily compare the two reports side-by-side and see how your sales have changed year-over-year. 3. When you need to analyze data at different levels of detail: Let's say you have a report for your sales by account and another report for your sales by product. By creating a joined report, you can drill down into the data at different levels of detail, such as seeing the sales by account for each product or the sales by product for each account. 4. When you need to combine data from different report types: If you have multiple report types with related data, such as opportunities and contacts, you can create a joined report to see how the two types of data are related. For example, you can see how many opportunities each contact has generated or how many contacts are associated with each opportunity. 5. When you need to create a more complex report: Sometimes a single report isn't enough to

	answer your business questions. By creating a joined report, you can combine multiple reports and data sources to create a more complex report that gives you a more comprehensive view of your data
--	--

	He created record type as opportunities.
	Opportunity status is closed won.
	
	Now we look at the outline, we see it gives the flexibility to choose whichever field we want. I thought it was gonna be same table. Its because cause its side by side.
