Heading 4

Nuances

IsPrivate or IsClosed

OWDS

Object	Internal access	Grant using Hierarchies
Opportunity	Private	✓

Bobs opportunity gets bubbled through to his supervisor. Opportunity object in the Detail section has private checkbox or IsPrivate Api. Which checked will not let this record to surfaced to his supervisor.

This option is used to hide an opportunity record until a milestone is reached. This is just programming discipline.

User license

User license.	A user's license determines the baseline of features that the user can access. You assign user permissions for data access through a profile and optionally one or more permission sets.
Custom app focused → Lightning platform full crm access → Salesforce user license.	Allison needs access to custom apps , but not the full CRM functionality. Assign Allison a Lightning Platform user license, which supports standard object permissions for accounts and contacts, but not cases. George needs full access to standard CRM apps and objects. Assign George a Salesforce user license, which allows you to grant them standard object permissions for accounts, contacts, and cases.
You change user license at User detail page.	You assign licenses to users when they're added to your org. You can change a user's license on their User Detail page. Changing a user's license also removes any permission sets and permission set licenses that are assigned to the user.

Update a user license

	User permissions needed
To create, edit, delete profile	Manage profile and PS
To manage profile and login as users	Manage users

When to use an Internal or External Licenses

	Sf supports multiple usecases and shareholders, such as employees, partners, brokers and end customers.
Internal user an internal license	Login either through <code>login.salesforce.com</code> or through company specific my domain login url <code>acme.my.salesforce.com</code> . Using an internal license. Internal users can also access Experience cloud sites.
External user (connected to CRM)	SF customers wants to create an experience connected to their CRM data for their end customers, prospects, partners, brokers, dealers and external shareholders use external licenses to provide access.
Usecases	Some typical use cases are partner portals, self-service forums and help centers, customer portals, and broker and dealer portals
What about consultants? Or lawyers and accountants who work for multiple companies.	Give them internal license.
???	If your company is using a custom app to allow internal users to access CRM data, you can use the Salesforce Platform Login license, instead of buying a seat-based license. The Salesforce Platform Login license allows you to pay for internal user access by login.
When do customer use external license	Privacy, security. Restrict access to data. Limited PS(cant manage other users in org or have modify all data). For example, a broker could need access only to a subset of information in your org. Acme has an internal sales team, but it also has independent brokers who sell Acme products. The brokers must access leads and opportunities, but they don't need to see the company's internal Chatter feeds or cases.

	Other examples of Acme users who could need external licenses are: • End customers (that is, customers of Acme) • System integrators • Franchisees • Resellers • Distributors • Wholesalers • Retailers • Agents • Dealers • Anyone in the Acme sphere who isn't an employee
These Experience Cloud licenses are only to be used by external users. Don't assign them to internal employees or contractors.	External Apps External Apps Login Channel Account Customer Community Customer Community Login Customer Community Plus Customer Community Plus Login Partner Community Partner Community Login

Standard users licenses

	These licenses include the Salesforce and Platform user licenses.
Salesforce user license	Salesforce user licenses are for users who need full access to Salesforce CRM objects and AppExchange apps.
Platform user license	are for users who need access to custom apps but don't need full access to standard CRM objects.
Seat based and login-based licenses • Same access and functionalities. • With different pricing options • SF Platform is seat based.	Salesforce platform and salesforce platform login licenses offers the same access and functionality, but with different pricing option. SF platform licenses is seat based for an extent of the contract. SF login license is for occasional needs. You purchase the no of logins. You can login multiple times, its counted as one.
Salesforce and platform user license	
Salesforce	Designed for users who require full access to standard CRM and AppExchange apps. Users with this user license are entitled to access any standard or custom app.
Knowledge Only User PS: Manage Article permission. To view, AllowViewKnowledge PS on a cloned profile.	Access to SF knowledge app. This license provides access to custom objects, tabs and these standard objects. Articles ●Article Management ●Chatter ●Files ●Home ●Profile ●Reports ●Custom objects ●Custom tabs Article management tab. Only profile that grants access to the articles tab. To view and manage Article management tab, a user must have the manage article permission. To view articles, a user must have the AllowViewKnowledge permission on their profile. But this permission is off for default profiles. To give a user the AllowViewKnowledge permission on their profile, activate the permission on a cloned profile and assign the cloned profile to the user.
Identity only	

Identity only	Provides extra licenses for employees to access only identity services, such as single sign-on (SSO). For example, some of your employees don't need access to all the solutions included with a Salesforce license. But you want these employees to be able to sign in to a custom Your Benefits web app directly from your Salesforce org using SSO. You can purchase the Identity Only license for them. This license provides access to the same identity services that are included with your other paid licenses in the Enterprise, Unlimited, Performance, and Developer Editions.
External only	Access to Salesforce Customer Identity, which enables customers and partners to self-register, log in, update their profile, and securely access web and mobile apps with a single identity. Plus, you can customize Customer Identity to your specific business process and brand using the power of the Salesforce Platform. For more information, see External Identity License Details and Salesforce Identity Licenses .
Salesforce integration	Grants access to Salesforce data and features only through the API. This license is designed for system-to-system integrations. It can't be used for human users that must access Salesforce data or features through any user interface.
WDC Only User	Designed for users who don't have a Salesforce license and need access to WDC.

Salesforce platform

Custom access w/ subset of crm std apps. Have not: access to leads, opportunities, cases and campaign.	Seat-based license, designed for users who need access to custom apps but not to standard CRM functionality. Users with this user license can use custom apps developed in your organization or installed from AppExchange. Also, they can access core platform functionality such as accounts, contacts, reports, dashboards, documents, and custom tabs. These users aren't entitled to some user permissions and standard apps, including standard tabs and objects such as forecasts, leads, campaigns, and opportunities. Users with this license can also use Connect Offline. Users with a Salesforce Platform user license can access all the custom apps in your organization and can access the Lightning Console app if enabled.
SF platform login	It has the same features and functionality as the Salesforce platform license but with flexible, usage-based, pricing option instead of fixed per user/per month cost. targeted for employees who access it occasionally.
Lightning Platform – One app	Has the same rights as Salesforce platform user , plus they have access to unlimited number of custom tabs. But they are limited to one custom app, which is defined as up to ten custom objects. Limited to read only access to account and contact.
??	Users with this license can only view dashboards if the running user also has the same license.

Left the remaining:

https://help.salesforce.com/s/articleView?id=platform.users_license_types_available.htm&type=5

PSL

To provide and give access to features not included in their user license.	For example, you previously assigned a user a Salesforce Platform user license, which entitled the user to the objects and functionality required for the user's day-to-day tasks. You now want this user to have access to Lightning console apps, which isn't included in their user license. You purchase and assign a Lightning Console permission set license to the user, which allows them to be granted the Lightning Console User permission. After you grant this user this permission via a permission set, the user can use Lightning Console apps.
Permission sets extend users' functional access without changing their profiles.	Permission set licenses extend the functionality of user licenses. With permission set licenses, you can assign more permissions to users than their user license supports. Permission sets extend users' functional access without changing their profiles.
PSL comes before permission set	Said another way, users' assigned licenses define the maximum functionality available to them. Admins use permission sets to control the subset of permissions that each user has, so that each license can be tailored to fit numerous different user roles. For users to access additional license functionality, they must both be assigned the permission set license and a permission set containing the feature permissions. If you assign users permissions via a permission set and they don't have the required licenses, you receive an assignment error.
You can assign standard ps and the permission set license would be automatically be taken care of.	Some permission set licenses come with auto-generated standard permission sets, which make the administration process easier. When you assign users the standard permission set, these users are automatically assigned the related permission set license. For info on specific permission set licenses, see the related feature documentation.

Feature license Overview

Feature	PS	Feature Assginment
Purpose	Grants the <i>right</i> to use specific features and permissions that are not included in the User License.	Enables a specific, discrete feature for a user.
Granularity	High. It acts as a prerequisite license for assigning a granular Permission Set that grants specific CRUD permissions, custom object access, etc.	Low. It is a simple on/off switch on the User record to enable one feature.
Administrative Use	Required for complex add-ons and features (e.g., CPQ, Field Service, Health Cloud). You assign the PSL, then assign the related Permission Set.	Required for small, discrete features (e.g., Marketing User, Knowledge User, Flow User).
Example	Salesforce CPQ User, Salesforce Field Service Dispatcher.	Knowledge User, Marketing User, Flow User.

Feature License	What It Unlocks	Notes
Marketing User	Allows user to create, edit, and send Campaigns	Checkbox on User record
Flow User	Allows user to run flows	Legacy orgs only
Knowledge User	Grants ability to create/edit Knowledge Articles	Required for Knowledge
Service Cloud User	Enables Service Console, Entitlements, Case Teams	Used in Service Cloud
Offline User	Allows offline access in Salesforce Classic	Legacy feature

Key Trait: Each Feature License = one narrow feature.

You can assign multiple to a single user (they're *stackable*).

A **Permission Set License (PSL)** defines a *collection* of permissions that a user can gain through ps.

Permission Set License	What It Unlocks	Example Permission Sets
Salesforce CPQ	Access to CPQ objects like Quote, Product, Price Rule	“CPQ User”, “CPQ Admin”
Inbox	Email integration features	“Inbox Users”
Salesforce Scheduler	Appointment scheduling	“Scheduler User”
High Velocity Sales	Sales Cadences, Work Queues	“Sales Cadence User”
Einstein Analytics Plus	Analytics Studio features	“Analytics User”

Category	Feature License	Permission Set License (PSL)
Purpose	Toggle access to one feature	Bundle of advanced permissions
Assignment	Checkbox on User record	Assigned via Permission Sets or directly
Granularity	Single feature (e.g. Knowledge)	Multi-feature (e.g. CPQ, Einstein)
Stackable	Yes	Yes
Linked to Permission Sets?	No	Yes
Revocable	Yes (uncheck box)	Yes (remove PSL or permission set)
Common In	Core Salesforce features	Add-ons, managed packages
Analogy	Light switch	Expansion pack license
Example	“Service Cloud User”	“CPQ” or “Inbox PSL”

PSL

License aware license	Is a license aware PSL. Your PSL should be compatible with the user license.
	Field service dispatcher is only compatible with sales cloud.
	A Permission Set License is like an entitlement add-on that unlocks specific capabilities (features, objects, or app access) for a user. Think of it as “license keys” that enable features not automatically included in the user’s base license (like “Salesforce” or “Platform”). PSLs don’t directly grant CRUD permissions — instead, they make specific permission sets available that the user can then be assigned.

other examples of psl who they are compatible with:

PSL:

PSL Name	What It Unlocks	Who Typically Needs It	Compatible With	Notes / Use Case
Knowledge User	Grants access to Knowledge objects and features	Support Agents	Service Cloud / Salesforce	Required for Knowledge authors/editors
Field Service	Access to Work Orders, Service Resources, Scheduling	Field Technicians	Service Cloud	Adds FSL managed package objects
Einstein Activity Capture	Sync emails/calendar between Salesforce & Gmail/Outlook	Sales Reps	Sales Cloud, Platform	Requires Exchange/Google integration
High Velocity Sales (HVS)	Sales Cadences, Work Queues	Inside Sales Teams	Sales Cloud	Adds advanced sales workflow features
CPQ License	Configure-Price-Quote managed package access	Sales Reps	Salesforce / Platform	Enables CPQ custom objects & logic
Inbox License	Email integration, Send Later, Templates	Sales / Service Reps	Sales / Service Cloud	Adds Salesforce Inbox UI features
Platform Encryption	Ability to use Salesforce Shield encryption	Admins / Compliance	Any full license	Needed for Shield-level encryption setup
Service Cloud Voice	Telephony integration with Salesforce UI	Contact Center Agents	Service Cloud	Adds Voice Call object & voice panel
Einstein Analytics (CRM Analytics)	Analytics Studio app & datasets	Data Analysts	Salesforce / Platform	Used for AI dashboards
Chat User (Live Agent)	Access to Live Chat objects	Support Agents	Service Cloud	Adds Chat Transcript object
Financial Services Cloud PSL	FSC-specific managed package access	Bankers / Wealth Advisors	Salesforce / Platform	Adds Relationship Groups, Financial Accounts

Example

Scenario	Allowed?	Explanation
Platform user gets “Knowledge User” PSL		Platform license doesn’t include Case/Service features
Service Cloud user gets “Field Service” PSL		Compatible with Service Cloud features
Sales Cloud user gets “Einstein Activity Capture” PSL		Common Sales add-on
Platform user gets “CPQ License” PSL		Allowed if CPQ package supports Platform license
Community (Experience) user gets “Inbox” PSL		Not supported outside full internal licenses

Analogy

Level	Description	Analogy
User License	Defines which <i>floors</i> you're allowed to enter	"Sales", "Service", or "Platform" floor access
Profile	Defines which <i>rooms</i> on your floor you can enter	"Opportunities" room, "Cases" room, etc.
Permission Set License (PSL)	Adds <i>special keys</i> to open premium rooms on that same floor	"Einstein", "CPQ", "Inbox"
Permission Set	The <i>actual keycard settings</i> applied to the user	CRUD, FLS, and App visibility

Explanation:

Case	Possible?	Why
Add "Case" access to Platform user via PSL		Base license excludes Cases
Add "Einstein Search" to Platform user via PSL		PSL fits inside license boundary
Add "Field Service" PSL to Service Cloud user		Compatible
Add "CPQ" PSL to Platform user		Compatible (if CPQ package supports Platform)

Object permissions w.r.t License

Feature / Object	Salesforce	Salesforce Platform	Sales Cloud	Service Cloud
Accounts	Full	Full	Full	Full
Contacts	Full	<i>Read-only</i>	Full	Full
Opportunities	Full	None	Full	None
Leads	Full	None	Full	None
Cases	Full	None	None	Full
Campaigns	Full	<i>Read-only</i>	Full	<i>Read-only</i>
Custom Objects	Unlimited	Unlimited	Unlimited	Unlimited
Reports / Dashboards	Full	Full	Full	Full
Chatter				
App Access	All	1 Custom App (10 Custom Objects)	All	All
Knowledge Articles				
Entitlements / SLAs				
Service Console				
Einstein Features	Optional (via PSL)	Optional (via PSL)	Optional (via PSL)	Optional (via PSL)

Deleting field and implications

Issue 1.	If u have field dependency																				
Issue 2.	If u have assignment or escalation rules that rely on custom field data.																				
U can click on deleted fields to restore them. You have 15 days to restore them.	Fields & Relationships 11 Items, Sorted by Field Label Q. Quick Find NewDeleted FieldsField DependenciesSet History Tracking <table><thead><tr><th>FIELD LABEL</th><th>FIELD NAME</th><th>DATA TYPE</th><th>CONTROLLING FIELD</th><th>INDEXED</th></tr></thead><tbody><tr><td>Asset</td><td>Asset__c</td><td>Lookup(Asset)</td><td></td><td>✓</td></tr><tr><td>Created By</td><td>CreatedById</td><td>Lookup(User)</td><td></td><td></td></tr><tr><td>Currency</td><td>CurrencyIsoCode</td><td>Picklist</td><td></td><td></td></tr></tbody></table>	FIELD LABEL	FIELD NAME	DATA TYPE	CONTROLLING FIELD	INDEXED	Asset	Asset__c	Lookup(Asset)		✓	Created By	CreatedById	Lookup(User)			Currency	CurrencyIsoCode	Picklist

Currency	CurrencyIsoCode	Picklist																			
	Impact report or formula field.																				
	Impact workflow or validation rules																				
??	Impact on page layout and record types																				
If an external system relies on a field that you just delete, the integration may fail or not function correctly.	Impact on integration																				
Best practice	Remove the field from all page layouts: This will hide the field from users without deleting any data. 2.Remove the field from any automations: Check for and remove any references to the field in workflows, flows, or other automation tools. 3.Check for dependencies: Ensure the field is not referenced in other metadata or integrations. 4.Delete the field definition: Once all dependencies and automations are removed, you can safely delete the field itself.																				

Record type and chatgpt examples

Issue: when we create the asset followed by warranty record. In the warranty record, when we select accounts, it gives me the entire list of accounts almost all except few are not warranty providers.

Goal:

So we introduce record type.

	Record type let you offer different business process, picklist values and page layout to different users.
	You may create record types to differentiate between your regular sales deals with personal service agreement or engagement.
	You might display different page layout for your customer support cases versus your billing cases.
	If objects are nouns, then record types are the adjectives of the salesforce.

Scare me	It's important to consider the implications of the record type before doing so. That's because it does add a layer of complexity. You never want to introduce a record type unless you really need to have them.
Page layout based on record type	Scenarios: if u need different page layout based on the type of the record you're dealing with on an object.
picklist	If you're needing to provide different picklist values on different types of records for an object.
What we get	So on account record, we would be able to tell which are warranty providers, vendors, clients and so on.
	Record Types 0 Items, Sorted by Record Type Label Q Quick Find New Page Layout Assignment RECORD TYPE LABEL DESCRIPTION ACTIVE MODIFIED BY
	Record Type Existing Record Type --Master-- Record Type Label Warranty provider Record Type Name Warranty_provider Description Account that are warranty providers Active ☒
Make Available to create/clone/set default of this record type.	Select Make Available to give users assigned to this profile the ability to create and clone records of this record type, or assign this record type to existing records. To make the new record type the default for a profile, select Make Default. Users assigned to this record type can still view and edit records associated with record types not available for their profiles.
profiles	Profile Name Record Types Currently Available ☒ Make Available ☐ Make Default Analytics Cloud Integration User ☒ ☐ Analytics Cloud Security User ☒ ☐ Authenticated Website ☒ ☐ Authenticated Website ☒ ☐ B2B Reordering Portal Buyer Profile ☒ ☐ Chatter External User ☒ ☐ Chatter Free User ☒ ☐ Chatter Moderator User ☒ ☐

User	Profile	Available Record Types	Default	What Happens
Alice	Sales Rep	Retail, Enterprise	Retail	When she clicks “New Opportunity,” <i>Retail</i> is preselected, but she can choose <i>Enterprise</i> .
Bob	Support Agent	Service Only	Service	Can only create <i>Service</i> record types; can still view <i>Retail</i> Opportunities if shared with him.

	You can assign different page layout based on record types. 
	For warranty provider, I can provide different layout for each profile. This way u are more granular. This way, some receive one page layout and other receive a different layout.
We got our very first record type.	

Now, lets create another record type:

Existing record type is a template	The existing record type it ask for Master or warranty provider. In essence its asking that what picklist values configuration u want for this new record type.																					
	Do u want the default I.e Master or Warranty provider. If u choose Warranty provider, it will inherit the configuration of Warranty provider.																					
	Record Type Existing Record Type: --Master-- Record Type Label: Client Record Type Name: Client Description: Customers accounts that are one won or closed opportunity Active: ☒																					
	<table><tr><td>020 Requiring Portal Buyer Profile</td><td>Warranty provider (Default)</td><td>☒</td></tr><tr><td>Chatter External User</td><td>Warranty provider (Default)</td><td>☒</td></tr><tr><td>Chatter Free User</td><td>Warranty provider (Default)</td><td>☒</td></tr><tr><td>Chatter Moderator User</td><td>Warranty provider (Default)</td><td>☒</td></tr><tr><td>Contract Manager</td><td>Warranty provider (Default)</td><td>☒</td></tr><tr><td>Cross Org Data Proxy User</td><td>Warranty provider (Default)</td><td>☒</td></tr><tr><td>Custom: Marketing Profile</td><td>Warranty provider (Default)</td><td>☐</td></tr></table>	020 Requiring Portal Buyer Profile	Warranty provider (Default)	☒	Chatter External User	Warranty provider (Default)	☒	Chatter Free User	Warranty provider (Default)	☒	Chatter Moderator User	Warranty provider (Default)	☒	Contract Manager	Warranty provider (Default)	☒	Cross Org Data Proxy User	Warranty provider (Default)	☒	Custom: Marketing Profile	Warranty provider (Default)	☐

Renaming Page Layouts for Page layout assignment

Goal:

1. To educate when a user (with a particular profile) only have one record type, lets say prospect then any std/custom object records he will create will have the record type as prospect. No click events needed. Whereas, if a user(with other profile) having multiple options as record type, will be given an option to choose which record type.
2. The use of Picklist values. Its like dependent list.

New account record	
If u cant find which record type for warranty provider. Goto Object manager → Account → Record types → Page layout assignment. Since the layout is called Account(Marketing) layout. I can goto page layout and change it.	
Page layout → Account(Marketing) Layout → Layout properties → Change it.	
	I drag and drop Account source for record-detail page.

Editing page layout by record type

<

Using Chat-gpt for mass assigning Account record types

Problem: Whenever u introduce record type, there exist legacy record that have no input for that field.

	We don't want to mass update manually. Even if we filtered those record that are empty.
	You can handle them using flow or Apex triggers.
Apex code	List<Account> accountsToUpdate=[SELECT ID FROM Account WHERE RecordTypeId = null]; for(Account acc: accountsToUpdate){ acc.RecordTypeId='012Qy0000091DqrlAE'; } update accountsToUpdate;
I copied the record type id by going into Object Manager → Account → Record type → Select the record type → copy the url.	Or I could do this instead.
	SELECT Id, Name, DeveloperName FROM RecordType WHERE SOBJectType = 'Account' AND Name = 'Prospect'
	
	

Page layout Assignments Review

	He mentioned there you could have another type of master record page layout. He mentioned Client layout and Client administrator. In Client administrator layout where you could have admin fields displayed.																														
	This is quite common in the real world, as an administrator wanna see things that you wanna hide from your end users.																														
So we goto Client Layout																															
																															
Then add some fields concerning for System admin. Then goto Page layout assignment and assign it to System administrator.	<table><tr><td>Partner Community Login User</td><td>Prospect Layout</td><td>Client layout</td></tr><tr><td>Partner Community User</td><td>Prospect Layout</td><td>Client layout</td></tr><tr><td>Read Only</td><td>Prospect Layout</td><td>Client layout</td></tr><tr><td>SalesforceIQ Integration User</td><td>Prospect Layout</td><td>Client layout</td></tr><tr><td>Silver Partner User</td><td>Prospect Layout</td><td>Client layout</td></tr><tr><td>Solution Manager</td><td>Prospect Layout</td><td>Client layout</td></tr><tr><td>Standard Platform User</td><td>Prospect Layout</td><td>Client layout</td></tr><tr><td>Standard User</td><td>Prospect Layout</td><td>Client layout</td></tr><tr><td>System Administrator</td><td>Prospect Layout</td><td>Client Admin layout</td></tr><tr><td>Work.com Only User</td><td>Prospect Layout</td><td>Client layout</td></tr></table>	Partner Community Login User	Prospect Layout	Client layout	Partner Community User	Prospect Layout	Client layout	Read Only	Prospect Layout	Client layout	SalesforceIQ Integration User	Prospect Layout	Client layout	Silver Partner User	Prospect Layout	Client layout	Solution Manager	Prospect Layout	Client layout	Standard Platform User	Prospect Layout	Client layout	Standard User	Prospect Layout	Client layout	System Administrator	Prospect Layout	Client Admin layout	Work.com Only User	Prospect Layout	Client layout
Partner Community Login User	Prospect Layout	Client layout																													
Partner Community User	Prospect Layout	Client layout																													
Read Only	Prospect Layout	Client layout																													
SalesforceIQ Integration User	Prospect Layout	Client layout																													
Silver Partner User	Prospect Layout	Client layout																													
Solution Manager	Prospect Layout	Client layout																													
Standard Platform User	Prospect Layout	Client layout																													
Standard User	Prospect Layout	Client layout																													
System Administrator	Prospect Layout	Client Admin layout																													
Work.com Only User	Prospect Layout	Client layout																													
We see new fields like Segment, SIC Desc and more. Because the system admin has Client Admin Layout for record type:Client Only the Sys admin can see this, because he is only assigned Client Admin layout.																															

Creating Rollup Summary Fields

Problem: We have mass updated records to Prospect. But in reality, we have records of which many have closed won opportunity associated with them.

So we gonna create a field rollup summary that will display on these individual account records how many dollars of closed won opportunities are associated with these different accounts. So any records that have zero won opportunities we wont change.

Rollup summary field	A read-only field that displays the sum, minimum, or maximum value of a field in a related list or the record count of all records listed in a related list.
Correction: field to aggregate is used “Amount”	Master ObjectAccount Summarized ObjectOpportunities (1) Select Roll-Up Type COUNT SUM(2) MIN MAX Field to AggregateQuantity(3) Filter Criteria All records should be included in the calculation Only records meeting certain criteria should be included in the calculation FieldStage(4) Operatorequals Value --None-- --None-- --None-- --None-- --None-- --None-- --None-- --None-- ANDANDANDAND For checkbox fields, enter a value of True for checked or False for not checked. For picklist fields, enter the Lookup Select the picklist values to add below Deselect all Value Prospecting Qualification(4) Needs Analysis Value Proposition Id. Decision Makers Perception Analysis Proposal/Price Quote Negotiation/Review Closed Won Closed Lost

Mass Updating accounts Using a rollup summary

Problem: When we mass update all accounts to prospects. Some of those Accounts were client since they have closed won opportunity. To achieve to do that.

Apex code.	List<Account> accountsToUpdate=[SELECT ID FROM Account WHERE RecordTypeId = '012Qy0000091DqrIAE' and Total_Closed_Won_Opportunity__c > 0]; for(Account acc: accountsToUpdate){ acc.RecordTypeId='012Qy0000091CZp'; } update accountsToUpdate;

Creating a custom business process in salesforce

	So for client record type on account, we may want to initiate some sort of process to denote where a client is In their customer boarding process.
	So we create a picklist field.
	 The screenshot shows the 'Field Definition' page for a new picklist field named 'Client Onboarding stage'. The 'Field Label' is 'Client Onboarding stage'. Under 'Values', the option 'Enter values, with each value separated by a new line' is selected. A text area contains the following values: Welcome, Setup, Training, Support, and Renewal. Below the text area, the checkbox 'Display values alphabetically, not in the order entered' is unchecked, 'Use first value as default value' is checked, and 'Restrict picklist to the values defined in the value set' is checked. The 'Field Name' is 'Client_Onboarding_stag'. The 'Description' and 'Help Text' fields are empty.
	This would kick of one or multitude of processes that u want ur organization to do when u have a closed won opportunity and account becomes a client account. You can achieve automatically with a flow.
	Client onboarding process
	Welcome Setup: u do integration and handle billing. Training: trained ur client on the product or services to what expect as well. Support: Renewal
	He made the field optional. Since only client and admin client will be able to access. This field is only visible to client and admin client pagelayouts.

Creating a path for our Custom business process

Task: Just like the stages for Opportunities, we gonna create for account object. It's called path. So we want path to show only for client account since its client onboaring process.

User Interface → Path settings	Complete processes fast by keeping users focused on what's most important. By guiding users to the right fields and content at the right time, Path enforces and ensures adoption of your company's process. When you create paths, you choose the following. ◦ Which fields and content appear for your users at each step in the process. ◦ What good advice, reminders, links, and best practices to include at each step. ◦ How many different paths to provide. For example, provide different paths for inside sales and outside sales, or for delivery status of different products or services. ◦ When paths are available to your users. When you activate your path, Kanban also shows key fields and guidance for views based on the same object, record type, and picklist.
	Step 1: Name Your Path and Choose an Object The object and record type you choose determine the business process for your users. Path Name Client Onboarding stage API Reference Name Client_Onboarding_stage Object Account Record Type Client Picklist Client Onboarding stage
◦ Provide guidance for success, I Welcome Fields Account Name Billing Address Description Industry Phone + Add/Update Fields Welcome stage	Welcome Setup Fields Employees Number of Locations SLA SLA Expiration Date Upsell Opportunity Setup stage

Setup

Name and Record Type

Fields and Text

Finish

Adding path to page layout.

I just drag and drop the path to Accounts detail page.	
	Set component visibility filters, so it will display only if a certain value is true.
Activate.	Then I made It default for app, record type and profile.
	Default for Sales, Service console, Warranty management.
	
I can show or hide by profile	Select system admin and custom marketing profile.
	
Now I goto account and see the paths for client accounts	

I cant see the path for warranty accounts.

I login as Jim Lindsay I can see the path since he has custom marketing profile.
I login as Laura Garner I cant see the path since he has standard user profile.
